SPATIAL SIGNS: ON THE RELATIONSHIP BETWEEN ARCHITECTURE AND THE DESIGN OF COMMUNICATION MEDIA

Philipp Meuser

Every day, we all have to find our way around and get where we want to go – in life or among the objects in our immediate surroundings. Inside our own four walls. In the built environment. In the natural world. Since the dawn of time, we have had this in common with every creature on earth. It even used to be essential to stay alive. The hunter-gatherer followed animal tracks and smells and was guided by conspicuous features in the natural landscape to keep his bearings. There was always the position of the sun to fall back on, on the principle of *ex oriente lux* – from the East comes light. The sun and moon, and later the stars too, were unmistakable points of reference offering certainty about time and space. Time was measured by sun dials. There is unequivocal evidence of their existence since antiquity at least, as an early means of making the natural phenomenon of light readable in terms of a measurable value and defining time. Once mankind began to switch to a settled existence in about 6,000 BC, both buildings and settlements began to make their mark in the landscape all over Central Europe [III. 01]. Wayfinding was no longer solely dependent on the natural world. Man-made wayfinding aids were added to natural tracks and waymarkers [III. 02, 03]. People began to refine their senses with navigational aids of their own devising. Even now, hardly anything has changed in this control of our surroundings. When we try to find our way around in the man-made urban environment, we still use ancient navigational aids. We may use our senses or we may use the built resources. And yet our

modern buildings often conceal their true identity from us. At the very worst, they even lead us up a metaphorical garden path because the entrance is nowhere to be seen – or because the architect insisted on creating a work of art. There is no longer any question of wayfinding here. Anyway, our towns have become impossible to take in. With populations equalling those of states in the past, today's towns have in fact become city states. It is quite a business to feel at home in them. It is still relatively easy to go by rail because the railway takes its passengers to their destination, at least to a railway station. The car driver is left to his own devices. At certain junctures, the paths of rail users and car drivers cross in a thicket of signs, indicator boards, tram and bus numbers or in the intricate network of urban motorways, access and ring roads. Without navigation systems – either conventional metal signs or digital satellite signals – it's probable that the modern urbanite would hardly ever get anywhere at all. So complex information and guidance systems are now a symptom of the modern age. It is fitting that it took a philosopher and sociologist, the Viennese Otto Neurath, to develop the first image-based system for public spaces in the 1920s, a system developed for streets, railways stations, airports, hotels, department stores and hospitals and also for major commercial and sporting events [III. 04]. The sole reason for this was the human need to be able to find one's way around unaided in unfamiliar locations without having to speak to anyone. To this, we can add finding your
